List of Experiments

| No. of Experiments | Topic(s) related to Experiment |
|--------------------|---|
| 1 | Write a C++ program to sort the elements in ascending and descending order. |
| 2 | Write a C++ program to find the sum of all the natural numbers from 1 to n. |
| 3 | Write a C++ program to swap 2 values by writing a function that uses call by reference technique. |
| 4 | Write a C++ program to demonstrate function overloading for the following prototypes. add(int a, int b) add(double a, double b) |
| 5 | Create a class named Shape with a function that prints "This is a shape". Create another class named Polygon inheriting the Shape class with the same function that prints "Polygon is a shape". Create two other classes named Rectangle and Triangle having the same function which prints "Rectangle is a polygon" and "Triangle is a polygon" respectively. Again, make another class named Square having the same function which prints "Square is a rectangle". Now, try calling the function by the object of each of these classes. |
| 6 | Suppose we have three classes Vehicle, FourWheeler, and Car. The class Vehicle is the base class, the class FourWheeler is derived from it and the class Car is derived from the class FourWheeler. Class Vehicle has a method 'vehicle' that prints 'I am a vehicle', class FourWheeler has a method 'fourWheeler' that prints 'I have four wheels', and class Car has a method 'car' that prints 'I am a car'. So, as this is a multi-level inheritance; we can have access to all the other classes methods from the object of the class Car. We invoke all the methods from a Car object and print the corresponding outputs of the methods. So, if we invoke the methods in this order, car(), fourWheeler(), and vehicle(), then the output will be: I am a car I have four wheels I am a vehicle Write a C++ program to demonstrate multilevel inheritance using this. |
| 7 | Write a function which throws a division by zero exception and catch it in catch block. Write a C++ program to demonstrate usage of try, catch and throw to handle exception. |
| 8 | Write a C++ program function which handles array of bounds exception using C++. |
